

ABSTRACT OF THE DISCLOSURE

The constitution of a further miniaturization of a mold pin is provided which improves concentrative mounting of the mold pin and simplifies a fixing cable to the press-fitting pin. A mold pin for cable terminal forms soldered portions for fixing conductive lines protruding from the connecting end of cable at the base end of each of the press-fitting pins where the soldered portions form notch portions and at proper positions of its edge portion and solder in such a manner that the conductive lines of the cable connecting ends are inserted into the notch portions and the notch portions fills with the conductive line to an appropriate thickness, and buries the soldered portion inside the resin mold body.
